I. Introduction

Room impulse response (RIR)

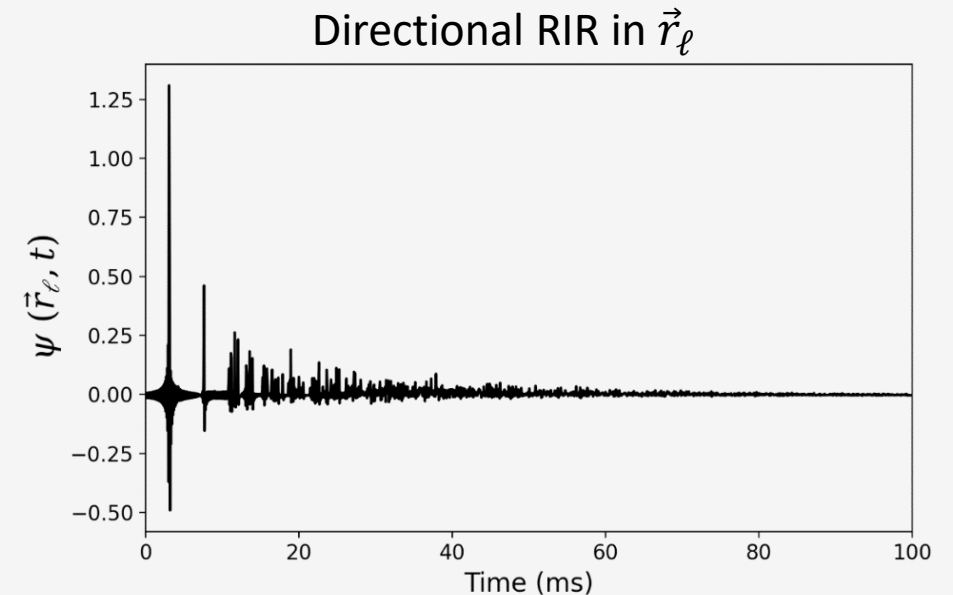

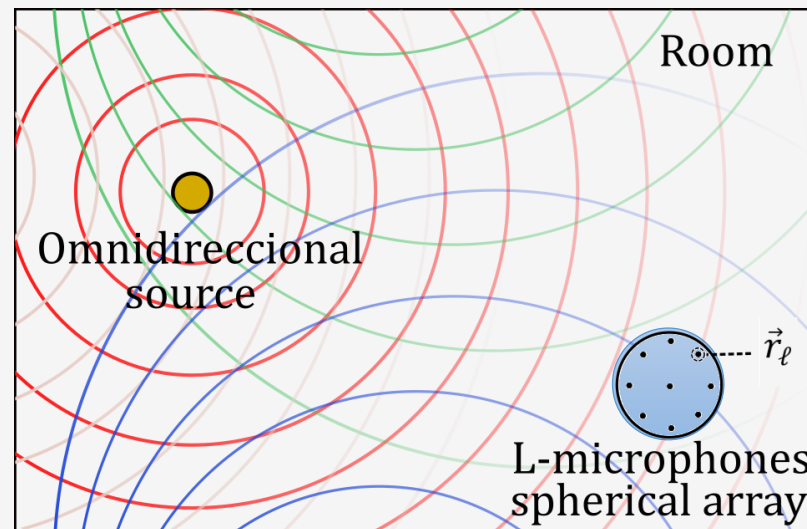

- Room response to sound propagation between a source and a receiver
- Key tool in **architectural acoustics** and spatial sound for **virtual reality**

I. Introduction

Room impulse response (RIR)

- RIR is sound pressure measured in a reverberant room with an impulse
- Directional RIR can be measured with a spherical microphone array

I. Introduction

RIR interpolation

- Either because of the low number of microphones or limited computational capacity, there is a need to interpolate RIRs

Low-resolution RIR

Interpolation
method

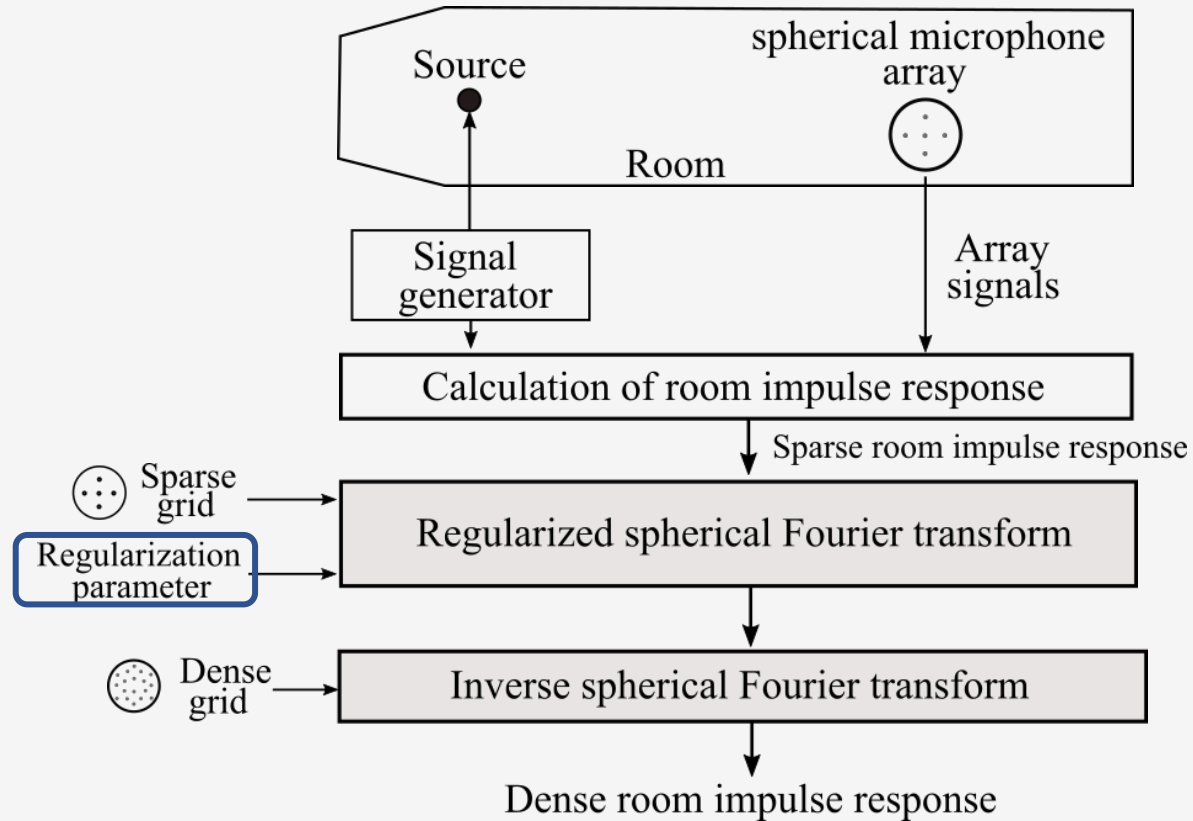

Based on the
regularized spherical
Fourier transform (SFT)

High-resolution RIR

I. Introduction

Proposal for RIR interpolation

II. Formulation of the regularized SFT

Continuous spherical Fourier transform (SFT) and inverse spherical Fourier transform (ISFT)

- The SFT and ISFT allows to express the **RIRs as a linear combination of orthonormal basis functions on the sphere (e.g., spherical harmonics)**

II. Formulation of the regularized SFT

Spherical discretization

II. Formulation of the regularized SFT

Regularized SFT

Sparse RIR

Interpolation based on
the regularized SFT

Dense RIR

- Frequency limit.
- Uniform distribution: Interpolation error ✓
- No-uniform distribution: Interpolation error ✓
- **Random distribution:** Interpolation error ✓

III. Evaluation of RIR interpolation

Initial Conditions

Room dimensions

4.62m wide, 3.84m long, 3m high.

Reverberation time: 0.2 s.

Sampling frequency: 16 kHz.

Number of samples in time: 3200.

Sparse grid

Radius: $r = 8\text{cm}$

Random distribution, $L = 49, 16$.

Dense grid

Icosphere distribution, 162 microphones

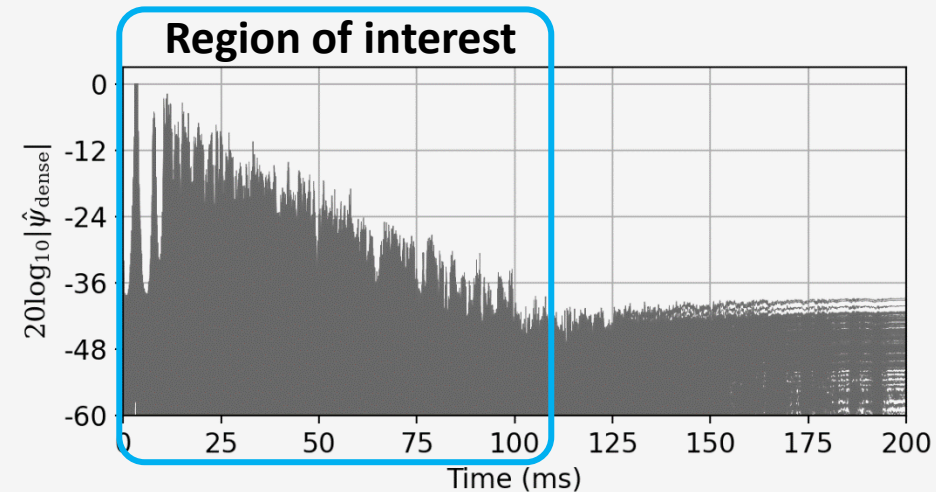

III. Evaluation of RIR interpolation

RIR energy comparison

- In both cases, the energy remains concentrated within the first 100 ms
- Envelopes are very similar in the region of interest

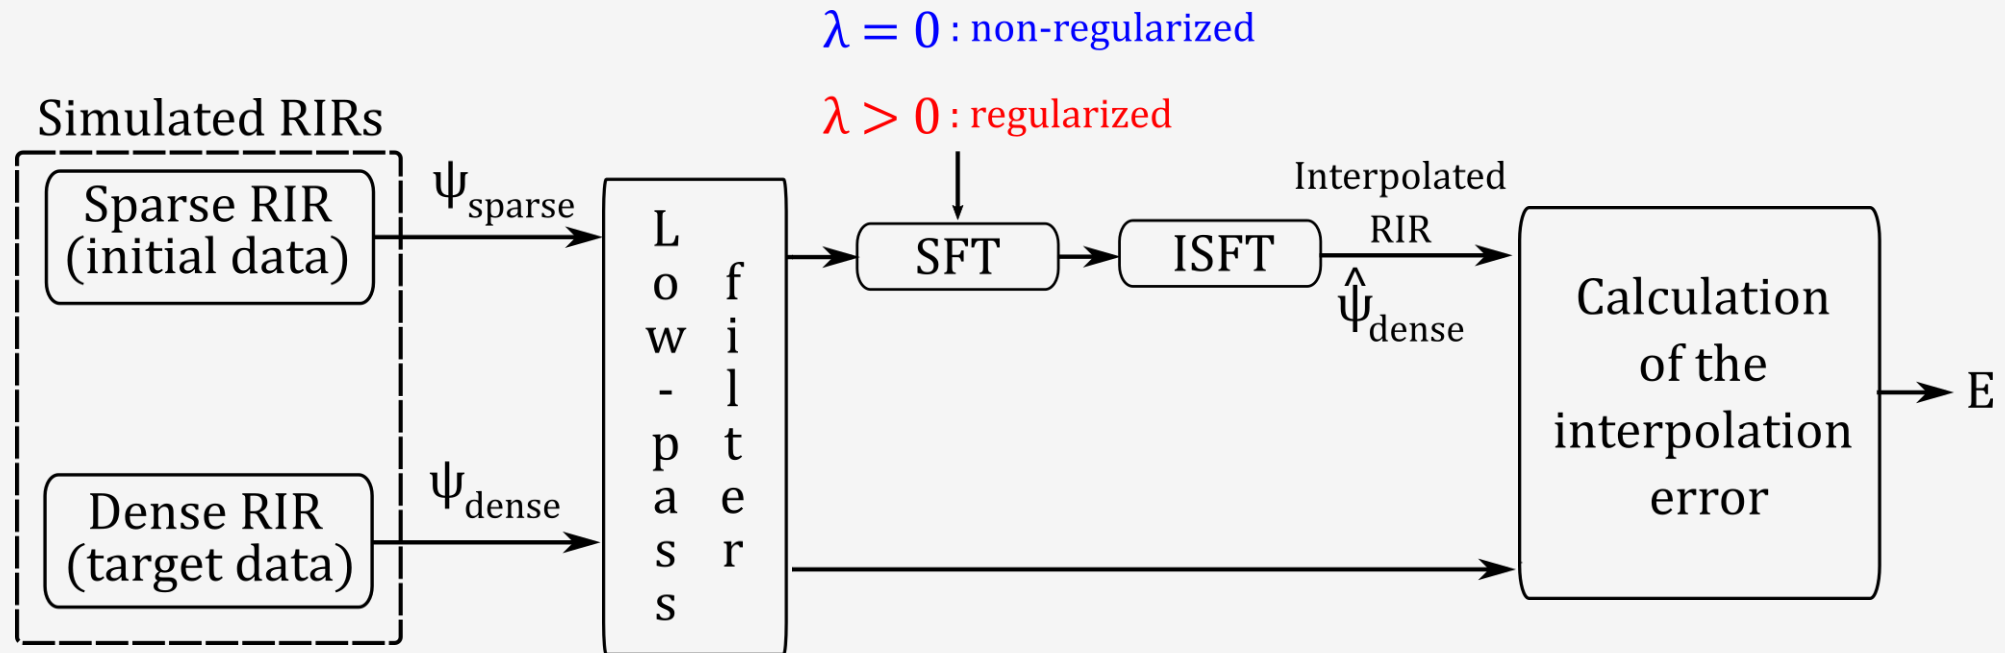

Energy of the target RIRs

Energy of the interpolated RIRs

III. Evaluation of RIR

Interpolation error

III. Evaluation of RIR interpolation

Interpolation error

Number of microphones: $L = 49$
Max order: $N_{\max} = 6$

Number of microphones: $L = 16$
Max order: $N_{\max} = 3$

IV. Conclusions

- Regularized SFT based interpolation maintained the errors bounded at high-energy values in time
- Extensions to this work might include physics-based frameworks for the reconstruction of sound pressure fields
- Open-source library available at:

Spherical Acoustic

1. Room impulse response (RIR) interpolation example

An example of RIR interpolation can be run in [RIR_interpolation_Intercon21_example.ipynb](#). (Google Colab notebook)

- Interpolation errors using the regularized and non-regularized spherical Fourier transform are compared.
