

# César D. Salvador

## Acoustic Information Science

Date of birth: 9 March 1978.

Nationality: Peruvian.

## Resume

I received the Ph.D. and M.Sc. degrees in 2016 and 2013, respectively, both from the Graduate School of Information Sciences, Tohoku University, Sendai, Japan. Tohoku University was ranked 76th in the world in the QS World University Rankings 2018. Currently, I work as an Assistant Professor at the Research Institute of Electrical Communication (RIEC), Tohoku University. RIEC is famous for having made pioneering achievements in communication technology, including the Yagi-Uda antenna, magnetic recording systems, optical communication technologies, and acoustic information systems.

My research on acoustic information science lies at the intersection of theoretical acoustics, array signal processing, human perception, and computational neuroscience. My research focuses on challenges that arise when aiming at the flexible, computationally efficient analysis of auditory scenes, their transmission, and their synthesis with high levels of realism and naturalness. I formulate and design methods for the recording, processing, and reproduction of acoustic environments. Such methods are required, for instance, in machines that yearn to equal the performance of human perception for acoustic environment recognition, in acoustically-transparent devices for hearing aid, in three-dimensional audio installations oriented to large audiences, and in personal audio systems for virtual and augmented reality.

In 2017, I started the research project “Perceptual Constancy in Spatial Hearing”. This research aims at contributing to the emergence of future cognitive-based audio processing methods for acoustic environment recognition. To achieve this, patterns of invariability are being identified along databases of morphological and acoustical descriptors of the listeners’ external anatomy. This research also aims at establishing mathematical correspondences between the topological index of invariability and the statistical index of connectivity in the auditory brain.

I am seeking opportunities for interdisciplinary collaboration towards the synergic integration of hearing and other modes of perception (e.g., vision and touch). Such integration aims at the devising of a comprehensive framework for multimodal information processing. This framework will enable the creation of multimodal perception systems for robots, human-computer interaction, enhanced hearing aids, immersive environments, and telepresence systems for future telecommunications.

## Education

2013–2016 **Ph.D., Information Sciences**, Tohoku University, Sendai, Japan.

- Doctoral Dissertation: *Binaural Synthesis Based on Spherical Acoustics*
- Advisor: Yôiti Suzuki
- Examiners: Yôiti Suzuki, Shuichi Sakamoto, Akinori Ito, Yoshifumi Kitamura
- Tohoku University Repository: <http://hdl.handle.net/10097/00121125>

- 2011–2013 **M.Sc., Information Sciences**, *Tohoku University*, Sendai, Japan.
- Master Thesis: *Binaural Synthesis Based on the Spherical Harmonic Analysis with Compact Microphone Arrays*
  - Advisor: Yôiti Suzuki
  - Examiners: Yôiti Suzuki, Shuichi Sakamoto, Akinori Ito, Kazuyuki Tanaka
  - Tohoku University Repository: <http://hdl.handle.net/10097/56638>
- 2005 **B.Sc., Electrical Engineering (Bachiller en Ciencias e Ingeniería, Especialidad Ingeniería Electrónica)**, *Pontifical Catholic University of Peru*, Lima, Peru.

## Professional Experience

- 2017–Present **Assistant Professor (Specially Appointed for Research)**, *Advanced Acoustic Information Systems Laboratory, RIEC, Tohoku University*.
- Start of activities as Principal Investigator of the project “Perceptual Constancy in Spatial Hearing,” supported by a Grant-in-Aid of the Japan Society for the Promotion of Science (JSPS), under Grant JP17K12708 (2017–2018). This project aims at the formulation of human-oriented audio processing methods for the identification and localization of sound. Partial results have been reported in a conference paper (see [C4] in my list of publications).
  - Continuation of the research activities on physically-motivated high-definition spatial audio, which constitute a sequel to my doctoral and postdoctoral research. The results were published in two journal papers (see [J2,J3] in my list of publications).
  - In charge of the international collaboration with Technical University of Dresden and the University of Oldenburg, both in Germany.
  - Tutoring of undergraduate and graduate students during their research, teaching of short courses in theoretical acoustics, and organization of exhibitions and demonstrations for the annual Open Campus.
- 2016–2017 **Postdoctoral Researcher**, *Advanced Acoustic Information Systems Laboratory, RIEC, Tohoku University*.
- Formulation of physically-motivated array signal processing methods for high-definition spatial sound systems. Part of these works was a sequel to my doctoral thesis. Results were published in three journal papers (see [J4–J6] in my list of publications).
  - Tutoring of undergraduate and graduate students, and teaching of short courses.
- 2008–2010 **“Docente Investigador”, equivalent to Assistant Professor (Research)**, *Faculty of Communication Sciences, University of San Martin de Porres*, Lima, Peru.
- Principal Investigator of the project “Auralization: Towards the authentic representation of sound in space.” In this project, spatial sound technologies were applied to the recording, preservation, and reproduction of urban and rural soundscapes of Lima. The results were exhibited annually in the sound art festival “Lima Sonora”, and published in four international proceedings (see [C22–C25] in my list of publications).
  - Other responsibilities included the teaching of non-credit courses in real-time audio signal processing using Pure Data.
- 2006–2007 **Academic Coordinator**, *National Institute for Research and Training in Telecommunications (INICTEL)*, Lima, Peru.
- Planning and coordination of workshops in robotics. The workshops were oriented to students of the Army Technical School of Peru and were lectured by INICTEL’s academic staff.

- 2006–2010 **Teaching Assistant**, *Department of Sciences and Engineering, Pontifical Catholic University of Peru*, Lima, Peru.
- Actively involved in the elaboration of experiments and protocols for instruction in the laboratory sessions of the following undergraduate lectures within the specialties of telecommunications and electrical engineering: Communication theory (IEE253, TEL208), Digital signal processing (IEE210, IEE352, TEL233), Microwaves (TEL236), Antenna engineering (TEL345), Computer architecture (IEE208), and Calculus (MAT119).
  - I organized and lectured two short courses: Fundamentals of digital audio synthesis and processing (40 hours), and Image processing using matlab (20 hours).
  - As a member of the Digital Signal and Image Processing Research Laboratory, I conducted research on real-time digital signal processing with field-programmable gate arrays (FPGAs). One of my challenges was to optimize the channel vocoder effect for computer music by using the wavelet transform. The result was published in an international proceeding (see [C26] in my list of publications).

## Awards and Scholarships

- 2016 **Best Paper Award**, *11th International Conference on Intelligent Information Hiding and Multimedia Signal Processing*, for co-authoring the paper entitled “A compact representation of the head-related transfer function inspired by the wavelet transform on the sphere”.
- 2011–2016 **Scholarship**, *Japanese Ministry of Education, Culture, Sports, Science and Technology (MEXT or Monbukagakusho)*, to pursue studies in Graduate School of Information Sciences (GSIS), Tohoku University, Sendai, Japan.
- 2008 **Scholarship**, *Indian Technical and Economic Cooperation (ITEC)*, to attend a two-months training course on Remote Sensing and Geographical Information Systems at the Indian Institute of Remote Sensing (IIRS), Dehradun, India.
- 2007 **Honorable Mention**, *UNESCO and Daimler Mondialogo Engineering Award*, for co-authoring a project focused on improving the diagnosis and treatment of tuberculosis and cutaneous Leishmaniasis in Peru using medical imaging techniques, in collaboration with graduate students of the University of Rochester and undergraduate students of the Pontifical Catholic University of Peru.

## Research Funding

- 2017–2018 **Grant-in-Aid for Young Scientists (B)**, *Japan Society for the Promotion of Science (JSPS)*, for the project “Perceptual Constancy in Spatial Hearing”, JSPS Grant JP17K12708.  
 ≈ 35,000 USD
- 2018 **Travel Grant**, *European Project Center (EPC), and Institute of Acoustics and Speech Communications (IAS), TU Dresden*, to enable participation in the workshop on the MSC Individual Fellowships Program, with the project “High-definition Acoustic Reconstruction for Multisensory Environments”, Dresden, Germany, June 2018.  
 ≈ 3,000 USD
- 2016 **Travel Grant**, *Murata Science Foundation*, to present the paper “Numerical evaluation of binaural synthesis from rigid spherical microphone array recordings” at the Audio Engineering Society International Conference on Headphone Technology, held in Aalborg, Denmark, from Aug. 24th to Aug. 26th, 2016.  
 ≈ 3,000 USD

---

## Specialized Fields

**Spatial Acoustics** Understanding the spatial features of sound that arise from interactions of sound waves with the environment is essential in the development of sound field control technologies. In this field, my interests particularly concern the formulation and validation of accurate sound propagation models under distinct geometrical and physical boundary conditions. For this purpose, I rely on analytic methods of mathematical physics, numerical solutions to the acoustic wave equation, and experimental procedures with microphone and loudspeaker array technology.

**Spatial Hearing** Before impinging the eardrums, sound waves interact with the listeners' external anatomical shapes, such as their torso, head, and outer ears. The relation between the morphology of individual anatomical shapes and their acoustic filtering properties is viewed by many as holding the key to human spatial hearing and future spatial sound technology for personal use. My research activities in this field include: the construction of databases of morphological and acoustical descriptions of individuals; the modeling of such data along space, frequency, and the individual dimension; and the extraction of features related to generic and individual traits. To this aim, I rely on the following tools: treatment of three-dimensional human models acquired by magnetic resonance imaging and laser scanning, harmonic analysis, point cloud representation by dimensionality reduction, and topological data analysis.

**Array Signal Processing** The capture, processing, and rendering of spatial sound information involve the simultaneous treatment of multiple signals corresponding to multiple transducers arranged in space. My interests in this field include the formulation of array signal processing methods in abstract domains of representation where it is possible to unmask features that are otherwise hardly observed in the natural spatial domain. Such abstract domains enable the flexible analysis of spatial information and, therefore, the inclusion of low-complexity, optimal routines for array signal processing.

**Computational Neuroscience** Understanding the computational processes in the human brain that are involved in the sensation, perception, and cognition of sound is essential to contribute to the emergence of human-oriented audio processing methods. As part of the project "Perceptual Constancy in Spatial Hearing", I am reviewing recent models of structural (anatomical links) and functional (statistical association) connectivity that occur in the bottom-up (stimulus-driven) and top-down (task-oriented) neural pathways of the human auditory brain when sound identification and localization tasks are performed. By interpreting the state-of-the-art in auditory brain modeling from a signal processing perspective, recent findings in the fields of neurobiology, cognitive science, complex brain networks, and mathematical neuroscience are being integrated into a comprehensive framework for acoustic environment recognition.

**Applied Mathematics** The use of mathematical structures and categories to solve practical problems from physics and engineering in turn motivates the development of new mathematical theories. Such new theories then became the subject of study in pure mathematics, where abstract concepts are studied for their own sake. When conducting research in the above-mentioned specialized fields, I am always interested on identifying the invariant structures and categories that underly a problem (e.g., those related to properties that do not depend on the physical and geometrical conditions). The knowledge of such invariants can subsequently be used to generate new methodologies that can potentially be used to solve problems in other specialized fields.
